Supabase Embeddings Pipeline Test Document

This PDF is created to test the parse-pdf API endpoint. It describes an ingestion pipeline where files uploaded to Supabase Storage trigger a database event, invoke an Edge Function, extract text, generate OpenAI embeddings, and store them in PostgreSQL using pgvector.

Use cases include semantic search, retrieval augmented generation (RAG), and document-aware chatbots. If this text is returned by the parse-pdf API, then PDF parsing is working correctly.
